## CLAIMS

The claims as pending are:

- (previously presented): A method for cleaving cellular chromatin in a region of interest, the method comprising:
  - (a) selecting the region of interest;
  - (b) engineering a first zinc finger binding domain to bind to a first nucleotide sequence in the region of interest:
  - (c) providing a second zinc finger binding domain which binds to a second nucleotide sequence in the region of interest, wherein the second sequence is located between 2 and 50 nucleotides from the first sequence;
- (d) expressing a first fusion protein in the cell, the first fusion protein comprising the first zinc finger binding domain and a first cleavage half-domain; and
  - (e) expressing a second fusion protein in the cell, the second fusion protein comprising the second zinc finger binding domain and a second cleavage half domain;
     wherein
    - (i) the first fusion protein binds to the first nucleotide sequence,
    - (ii) the second fusion protein binds to the second nucleotide sequence,
    - (iii) said binding of the first and second fusion proteins positions the cleavage half-domains such that the cellular chromatin is cleaved in the region of interest, and
    - (iv) in at least one of the first or second fusion proteins, the cleavage half-domain is closer to the N-terminus and the zinc finger binding domain is closer to the C-terminus.
- (original) The method of claim 1, wherein cleavage occurs between the first and second nucleotide sequences.
- (original) The method of claim 1 wherein the second zinc finger binding domain is engineered to bind to the second nucleotide sequence.

USSN: 10/587,723 8325-0036.31 S36-US3

- (original) The method of claim 1 wherein the first and second cleavage halfdomains are from the same endonuclease.
- 5. (original) The method of claim 4 wherein the endonuclease is a Type IIS restriction endonuclease.
- (original) The method of claim 5 wherein the Type IIS restriction endonuclease is Fok I.
- (original) The method of claim 1 wherein the cellular chromatin is in a chromosome.
- (original) The method of claim 1, wherein the first cleavage half domain is from a Type IIS restriction endonuclease.
- (original) The method of claim 1, wherein the second cleavage half domain is from a Type IIS restriction endonuclease.
- (original) The method of claim 1, wherein the first and second nucleotide sequences are on opposite strands of DNA.
- (original) The method of claim 10, wherein, in the first and second fusion
  proteins, the cleavage half-domains are closer to the N-termini and the zinc finger binding
  domains are closer to the C-termini.
- (original) The method of claim 1, wherein the first and second nucleotide sequences are on the same strand of DNA.
- (original) The method of claim 12 wherein, in the first fusion protein, the cleavage half-domain is closer to the N-terminus and the zinc finger binding domain is closer to

USSN: 10/587,723 8325-0036.31 S36-US3

the C-terminus and, in the second fusion protein, the zinc finger binding domain is closer to the N-terminus and the cleavage half-domain is closer to the C-terminus.

14. (original) The method of claim 12 wherein, in the first fusion protein, the zinc finger binding domain is closer to the N-terminus and the cleavage half-domain is closer to the C-terminus and, in the second fusion protein, the cleavage half-domain is closer to the N-terminus and the zinc finger binding domain is closer to the C-terminus.
